DATE MAILED: 09/13/2004

Please find below and/or attached an Office communication concerning this application or proceeding.

<b>Office Action Summary</b>	<b>Application No.</b>	<b>Applicant(s)</b>	
	10/063,715	EATON ET AL.	
	<b>Examiner</b>	<b>Art Unit</b>	
	Sandra Wegert	1647	

-- The MAILING DATE of this communication appears on the cover sheet with the correspondence address --

#### Period for Reply

A SHORTENED STATUTORY PERIOD FOR REPLY IS SET TO EXPIRE 3 MONTH(S) FROM THE MAILING DATE OF THIS COMMUNICATION.

- Extensions of time may be available under the provisions of 37 CFR 1.136(a). In no event, however, may a reply be timely filed after SIX (6) MONTHS from the mailing date of this communication.
  - If the period for reply specified above is less than thirty (30) days, a reply within the statutory minimum of thirty (30) days will be considered timely.
  - If NO period for reply is specified above, the maximum statutory period will apply and will expire SIX (6) MONTHS from the mailing date of this communication.
  - Failure to reply within the set or extended period for reply will, by statute, cause the application to become ABANDONED (35 U.S.C. § 133).
- Any reply received by the Office later than three months after the mailing date of this communication, even if timely filed, may reduce any earned patent term adjustment. See 37 CFR 1.704(b).

#### Status

- 1) ☒ Responsive to communication(s) filed on 17 September 2002.
- 2a) ☐ This action is **FINAL**.                      2b) ☒ This action is non-final.
- 3) ☐ Since this application is in condition for allowance except for formal matters, prosecution as to the merits is closed in accordance with the practice under *Ex parte Quayle*, 1935 C.D. 11, 453 O.G. 213.

#### Disposition of Claims

- 4) ☒ Claim(s) 1-20 is/are pending in the application.
- 4a) Of the above claim(s) \_\_\_\_\_ is/are withdrawn from consideration.
- 5) ☐ Claim(s) \_\_\_\_\_ is/are allowed.
- 6) ☒ Claim(s) 1-20 is/are rejected.
- 7) ☐ Claim(s) \_\_\_\_\_ is/are objected to.
- 8) ☐ Claim(s) \_\_\_\_\_ are subject to restriction and/or election requirement.

#### Application Papers

- 9) ☒ The specification is objected to by the Examiner.
- 10) ☒ The drawing(s) filed on 08 May 2002 is/are: a) ☒ accepted or b) ☐ objected to by the Examiner.  
Applicant may not request that any objection to the drawing(s) be held in abeyance. See 37 CFR 1.85(a).  
Replacement drawing sheet(s) including the correction is required if the drawing(s) is objected to. See 37 CFR 1.121(d).
- 11) ☐ The oath or declaration is objected to by the Examiner. Note the attached Office Action or form PTO-152.

#### Priority under 35 U.S.C. § 119

- 12) ☐ Acknowledgment is made of a claim for foreign priority under 35 U.S.C. § 119(a)-(d) or (f).
- a) ☐ All    b) ☐ Some \*    c) ☐ None of:
1. ☐ Certified copies of the priority documents have been received.
  2. ☐ Certified copies of the priority documents have been received in Application No. \_\_\_\_\_.
  3. ☐ Copies of the certified copies of the priority documents have been received in this National Stage application from the International Bureau (PCT Rule 17.2(a)).
- \* See the attached detailed Office action for a list of the certified copies not received.

Art Unit: 1647

**Detailed Action**

***Status of Application, Amendments, and/or Claims***

The Preliminary Amendment, submitted 10 September 2002, and the Information Disclosure Statement, submitted 17 September 2002, have been entered.

Claims 1-20 are under examination in the Instant Application.

**Informalities**

***Specification***

The disclosure is objected to because of the following informalities:

***URL's***

The disclosure is objected to because it contains browser-executable code. This occurs, for example, in paragraph 205. All URL's should be removed from the Specification. Applicant may refer to web sites by non-executable name only. See MPEP § 608.01 (p).

Appropriate correction is required.

***Continuity***

This application claims priority to the following patent applications: US provisional application 60/097,971, PCT/US99/12252, US application 09/380,137, PCT/US00/23328 and US application 10/006,867. Applicant has not complied with one or more conditions for receiving the benefit of an earlier filing date under 35 U.S.C. 119(e) as follows: Parent

Art Unit: 1647

applications do not describe or disclose data that would impart specific and substantial Utility to the instant invention; as well, the instant Invention lacks Utility. Therefore, for this Office Action, the filing date of 8 May 2002 is considered as the priority date.

**Claim Rejections/Objections**

***Claim Rejections - 35 USC § 101 and 35 USC § 112, first paragraph***

The following is a quotation of 35 U.S.C. 101:

**Whoever invents or discovers any new and useful process, machine, manufacture, or composition of matter, or any new and useful improvement thereof, may obtain a patent therefor, subject to the conditions and requirements of this title.**

The following is a quotation of the first paragraph of 35 U.S.C. 112:

**The specification shall contain a written description of the invention, and of the manner and process of making and using it, in such full, clear, concise, and exact terms as to enable any person skilled in the art to which it pertains, or with which it is most nearly connected, to make and use the same and shall set forth the best mode contemplated by the inventor of carrying out his invention.**

Claims 1-20 are rejected under 35 U.S.C. 101 because the claimed invention lacks a credible, specific and substantial asserted utility or a well-established utility.

The claims are directed to nucleotides which encode a polypeptide of 313 amino acids (see Figure 88 and SEQ ID NO: 88). Further claim limitations are presented to isolated nucleic acids having at least 80-99% sequence identity to a nucleic acid encoding the polypeptide of SEQ ID NO: 88 or encoding the polypeptide lacking its associated signal peptide. Claims are also presented encompassing vectors and cells comprising nucleic acids having at least 80-99% sequence identity to SEQ ID NO: 87. However, the specification does not disclose a function for

Art Unit: 1647

the nucleotide of SEQ ID NO: 87 or the polypeptide of SEQ ID NO: 88, in the context of the cell or organism.

No well-established utility exists for newly isolated complex biological molecules.

However, the specification asserts the following as credible, specific and substantial patentable utilities for the claimed putative polynucleotide and polypeptide encoded by the claimed polynucleotide:

- 1) To make hybridization probes to detect the polynucleotide of SEQ ID NO: 87.
- 2) To produce the PRO1270 polypeptide and fragments.
- 3) For use in chromosome mapping.
- 4) For use in the construction of “knock-in” or “knock-out” organisms.
- 5) For making antisense oligonucleotides.
- 6) In assays to screen for compounds capable of modifying the interaction between

receptor and ligand.

- 7) To make antibodies to the polypeptide encoded by the polynucleotide of SEQ ID NO: 87.

- 8) In tissue typing.

- 9) To detect and treat cancer (Table 9).

Each of these shall be addressed in turn:

- 1) To make hybridization probes to detect the polynucleotide of SEQ ID NO: 87.*

This asserted utility is not specific or substantial. Hybridization probes and primers can be designed from any polynucleotide sequence. The specification does not disclose specific

Art Unit: 1647

cDNA, DNA, or RNA targets. Further, since this asserted utility is not present in mature form, so that it could be readily used in a real world sense, the asserted utility is not substantial.

2) *To produce the PRO1270 polypeptide and fragments.* This asserted utility is also substantial, but not specific. Many nucleotide sequences can be used to make polypeptides. However, if the specification discloses nothing specific and substantial about the polynucleotides or polypeptides, both the polynucleotides and polypeptides produced have no patentable utility.

3) *For use in chromosome mapping.* This asserted utility is neither substantial nor specific. Probes and primers can be designed from any polynucleotide sequence and used for chromosomal localization of a gene of interest; thus the asserted utility is not specific. Further, the specification does not disclose specific cDNA, DNA, or RNA targets. Since this asserted utility is not present in mature form, so that it could be readily used in a real world sense, the asserted utility is not substantial.

4) *For use in the construction of "knock-in" or "knock-out" organisms.* This asserted utility is not specific or substantial. The specification does not disclose diseases associated with a mutated, deleted, or translocated PRO1270 gene. Significant further experimentation would be required of the skilled artisan to identify any such a disease. The specification discloses nothing about the phenotypic result when the PRO1270 gene is "knocked in" or "knocked out" or what specific tissues and cells are being targeted. Since this asserted utility is not present in mature form, so that it could be readily used in a real world sense, the asserted utility is not substantial.

5) *For making antisense oligonucleotides.* This asserted utility is not specific or substantial. Such can be performed for any polynucleotide. Further, the specification does not disclose diseases or conditions associated with the PRO1270 gene. Significant further

Art Unit: 1647

experimentation would be required of the skilled artisan to identify individuals in need of antisense treatment, to determine the route of administration of the antisense, as well as to determine gene targets and quantity and duration of treatment. Since this asserted utility is also not presented in mature form, so that it could be readily used in a real world sense, the asserted utility is not substantial.

6) *In assays to screen for compounds capable of modifying the interaction between receptor and ligand.* This asserted utility is substantial but not specific. Such can be performed for any receptor-ligand pair. Additionally, the specification discloses nothing specific or substantial for the compounds that can be identified by this method.

7) *To make antibodies to the polypeptide encoded by the polynucleotide of SEQ ID NO: 87.* This asserted utility is substantial, but not specific. Antibodies can be made to any polypeptide. However, if the specification discloses nothing specific and substantial about the polypeptide, the polypeptide, the polynucleotide encoding the polypeptide and antibodies have no patentable utility.

8) *In tissue typing.* This asserted utility is not substantial or specific. Such assays can be performed with any polypeptide encoded by a polynucleotide; thus, the asserted utility is not specific. Furthermore, the specification discloses limited tests of tissue expression. Applicant implies that this expression pattern supports a useful function of the polynucleotide encoding the PRO1270 polypeptide. However, patentable utility of tissue typing for the claimed polynucleotide encoding the PRO1270 polypeptide is not substantial, because one skilled in the art would not readily use the nucleotide sequences for tissue-typing in a real world sense as the protein is not specific to one tissue and is not associated with any disease or disorder. This

Art Unit: 1647

asserted utility is also not specific because numerous unrelated nucleotide sequences would also show a similar tissue typing pattern. In addition, evidence of mere expression in a tissue is not tantamount to a showing of a role for the polynucleotide of the present invention. It is not clear if expression of the polynucleotide of the present Invention is correlated with a specific change in physiology, for example, or with a disease state. Since this asserted utility is also not present in mature form, so that it could be readily used in a real world sense, the asserted utility is not substantial.

9) *To detect and treat cancer.* Table 9 of the instant Specification sets forth the results of assays to determine the expression of clone DNA66308-1537 in selected tissues:

"Molecule is more highly expressed in: as compared to:

DNA66308-1537 normal lung/lung tumor"

However, a slight increase or decrease in clone copies in tumors is not indicative of a specific or substantial utility for PRO1270 for use as an agent to detect or treat cancer. An increase in copy numbers of nucleic acids encoding PRO1270 in a cancerous tissue is more likely due to an increased number of chromosomes, a very common characteristic of cancerous and non-cancerous epithelial cells (see, for example: Hittelman, W., 2001, Ann. NY. Acad. Sci., 952: 1-12, especially pages 8 and 9, and; Crowell, et al, 1996, Cancer Epidemiol. 5: 631-637), not because PRO1270 is a target for therapeutic intervention in certain cancers. The asserted utility is therefore not substantial. Experiments confirming the specificity and substantial utility of PRO1270 in terms of mRNA concentration and protein expression were not performed. Significant further experimentation would be required of the skilled artisan to determine whether PRO1270 is expressed in certain cancers to the extent that antagonists (e.g., antibodies) directed

Art Unit: 1647

against the protein encoded by DNA66308-1537 (PRO1270) would be expected to have utility in cancer therapy. Thus, the asserted utility is not substantial.

Claims 1-20 are also rejected under 35 U.S.C. 112, first paragraph. Specifically, since the claimed invention is not supported by either a specific and substantial asserted utility or a well established utility for the reasons set forth above, one skilled in the art clearly would not know how to use the claimed invention.

Applicants have implied that the PRO1270 polypeptide is a secreted protein that can be used to diagnose or treat cancer. Examples from the secreted polypeptide art demonstrate, in some cases, polypeptides with high homology having a wide-variety of functions in organisms (see Hesselgesser, et al, 1997, Methods in Enzymology, 287: 59-69, see pages 59 and 64-66) and in other cases, many different possible structures for secreted proteins that are considered related as to function (Blease, et al, 2000, Resp. Res., 1(1): 54-61). However, Applicants have not associated the disclosed PRO1270 polypeptide with any type or genus of secreted peptide.

Furthermore, the results of the experimental assays are not considered substantial because it is known in the art that increased mRNA levels do not necessarily correlate to an increase in protein production, or do not correlate well. For instance, Haynes et al. (Electrophoresis, 1998, 19: 1862-1871) studied 80 proteins relatively homogenous in half-life and expression level, and found no strong correlation between protein and transcript levels for many genes. Equivalent RNA levels translated into changes in protein concentrations which varied by more than 50 fold. Haynes et al concluded that the protein levels cannot be accurately predicted from the levels of the corresponding mRNA transcripts (see page 1863, the second paragraph of the left column,

Art Unit: 1647

and Figure 1). Further, even if the increased PRO1270 mRNA correlates to an increase in protein production, it is still unclear the biological significance of PRO1270 in cancer cell proliferation (Table 9). The specification fails to provide evidence to illustrate the relationship between PRO1270 polypeptide and a positive change in cancer cell proliferation, which would support the assertion that PRO1270 may be useful for therapeutic treatment. As many proteins may regulate the PRO1270 peptide, one cannot extrapolate from increased mRNA levels that any protein, such as PRO1270, would be a useful target for treating cancer.

Due to the large quantity of experimentation necessary to determine an activity or property of the disclosed polypeptide such that it can be determined how to use the claimed polynucleotides encoding SEQ ID NO: 88 and to screen for activity, the lack of direction/guidance presented in the specification regarding same, the absence of working examples directed to same, the complex nature of the invention, the state of the prior art establishing that biological activity cannot be predicted based on structural similarity, the unpredictability of the effects of mutation on protein structure and function, and the breadth of the claims which fail to recite particular biological activities, undue experimentation would be required of the skilled artisan to make and/or use the claimed invention in its full scope.

***35 USC § 112, first paragraph – Written Description.***

Claims 1-6, 8-10, 14-20 are also rejected under 35 U.S.C. 112, first paragraph, as containing subject matter which was not described in the specification in such a way as to reasonably convey to one skilled in the relevant art that the inventor, at the time the application was filed, had possession of the claimed invention.

Art Unit: 1647

The claims are directed to nucleotide(s) which encode a polypeptide of 313 amino acids (see Figure 88). Further claim limitations are presented to isolated nucleic acids having at least 80-99% sequence identity to a nucleic acid encoding the polypeptide of SEQ ID NO: 88, or the polypeptide of SEQ ID NO: 88 lacking its associated signal peptide. Claims are also presented to nucleic acids encoding the extracellular domain of the protein.

The specification teaches a polynucleotide (SEQ ID NO: 87) and a polypeptide (SEQ ID NO: 88). However, the specification does not teach functional or structural characteristics of all claimed polynucleotides. The description of one polynucleotide encoding a PRO polypeptide (SEQ ID NO: 88) is not adequate written description of an entire genus of functionally equivalent polynucleotides and polypeptides.

To provide evidence of enablement of a claimed genus, the specification must provide sufficient distinguishing identifying characteristics of the genus. The factors to be considered include disclosure of complete or partial structure, physical and/or chemical properties, functional characteristics, structure/function correlation, methods of making the claimed product, or any combination thereof. In this case, the only factor present in the claim is a partial structure in the form of a recitation of percent identity or protein domains that have not been adequately identified. There is not even identification of any particular portion of the structure that must be conserved. Accordingly, in the absence of sufficient recitation of distinguishing identifying characteristics, the specification does not provide adequate written description of the claimed genus.

*Vas-Cath Inc. v. Mahurkar*, 19USPQ2d 1111, clearly states that “applicant must convey with reasonable clarity to those skilled in the art that, as of the filing date sought, he or she was

Art Unit: 1647

in possession *of the invention*. The invention is, for purposes of the ‘written description’ inquiry, *whatever is now claimed*” (See page 1117). The specification does not “clearly allow persons of ordinary skill in the art to recognize that [he or she] invented what is claimed” (See *Vas-Cath* at page 1116).

With the exception of the sequences referred to above, the skilled artisan cannot envision the detailed chemical structure of all claimed polynucleotides and all encompassed PRO polypeptides, and therefore, would not know how to use them. Conception is not achieved until reduction to practice has occurred, regardless of the complexity or simplicity of the method of use. Adequate written description requires more than a mere statement that it is part of the invention and reference to a potential method of use. The nucleotide itself is required. See *Fiers v. Revel*, 25 USPQ2d 1601 at 1606 (CAFC 1993) and *Amgen Inc. v. Chugai Pharmaceutical Co. Ltd.*, 18 USPQ2d 1016.

One cannot describe what one has not conceived. See *Fiddes v. Baird*, 30 USPQ2d 1481 at 1483. In *Fiddes*, claims directed to mammalian FGF’s were found to be unpatentable due to lack of written description for that broad class. The specification provided only the bovine sequence.

Therefore, only an isolated nucleic acid molecule comprising the nucleotide sequence of SEQ ID NO: 87 and a polypeptide comprising the amino acid sequence of SEQ ID NO: 88, but not the full breadth of the claims, meets the written description provision of 35 U.S.C. §112, first paragraph. Applicant is reminded that *Vas-Cath* makes clear that the written description provision of 35 U.S.C. §112 is severable from its enablement provision (see page 1115).

Art Unit: 1647

***Claim Rejections - 35 USC § 112, second paragraph***

The following is a quotation of the second paragraph of 35 U.S.C. 112:

**The specification shall conclude with one or more claims particularly pointing out and distinctly claiming the subject matter which the applicant regards as his invention.**

Claims 1-20 are rejected under 35 U.S.C. 112, second paragraph, as being indefinite for failing to particularly point out and distinctly claim the subject matter which applicant regards as the invention.

Claims 1-20 are rendered indefinite because of the phrase "extracellular domain." The metes and bounds of Claims 1-20 are indefinite in view of the instant Specification which implies and states that the polypeptide encoded by the claimed polynucleotide(s) is a secreted protein. Such an "extracellular domain" would be found in a cleaved transmembrane protein, for example, along with an intracellular domain, but is not recognized in secreted proteins since they are entirely "extracellular."

Claim 15 is rendered indefinite because of the phrase "stringent conditions," which is a conditional term. In other words, for example, some nucleic acids which are able to hybridize under stringent conditions would be unable to hybridize under non-stringent conditions. The metes and bounds of the claim, therefore, cannot be ascertained. This rejection can be overcome by supplying specific conditions, supported by the specification, which the Applicants consider "stringent," or by removing the indefinite phrase.

**Claim Rejections- 35 USC § 102**

Art Unit: 1647

The following are quotations of the appropriate paragraphs of 35 U.S.C. 102 that form the basis for the rejections under this section made in this Office action:

A person shall be entitled to a patent unless –

**(a) the invention was known or used by others in this country, or patented or described in a printed publication in this or a foreign country, before the invention thereof by the applicant for a patent.**

**(b) the invention was patented or described in a printed publication in this or a foreign country or in public use or on sale in this country, more than one year prior to the date of application for patent in the United States.**

Claims 1-5 and 16-19 are rejected under 35 U.S.C. 102(a) as being unpatentable over Suzuki, et al, (2002, Accession No. AF271386). Suzuki, et al disclose a polynucleotide sequence which is 99% similar to the PRO1270 nucleotide overall and which contains several lengths of nucleotides 10 or more bases long which are identical to several 10-base segments of the PRO1270 polynucleotide in the instant application (for example, residues 61-120 of Accession No. AF271386). This reference meets the limitations of Claims 1-5 and 16-19 of polynucleotides having at least 80-99% sequence identity to SEQ ID NO: 87 or "at least 10 nucleotides in length."

Claims 1-5 and 16-19 are rejected under 35 U.S.C. 102(b) as being unpatentable over Tsuji, et al, (2001, J. Biol. Chem., 276(26): 23456-23463). Tsuji, et al disclose a polynucleotide sequence which is 99% similar to the PRO1270 nucleotide overall and which contains several lengths of nucleotides 10 or more bases long which are identical to several 10-base segments of the PRO1270 polynucleotide in the instant application (for example, residues 1-1141 of Accession No. AB036706). This reference meets the limitations of Claims 1-5 and 16-19 of polynucleotides having at least 80-99% sequence identity to SEQ ID NO: 87 or "at least 10 nucleotides in length."

Art Unit: 1647

**35 U.S.C. 103(a)**

The following is a quotation of 35 U.S.C. 103(a) which forms the basis for all obviousness rejections set forth in this Office action:

**(a) A patent may not be obtained though the invention is not identically disclosed or described as set forth in section 102 of this title, if the differences between the subject matter sought to be patented and the prior art are such that the subject matter as a whole would have been obvious at the time the invention was made to a person having ordinary skill in the art to which said subject matter pertains. Patentability shall not be negated by the manner in which the invention was made.**

Claim 20 is rejected under 35 U.S.C. 103(a) as being unpatentable over Tsuji, et al, as applied to Claims 1-5 and 16-19 above, and further in view of Gray, et al, (1992, US Patent 5,169,762). Gray et al discuss expression of the claimed nucleic acid in a variety of prokaryotic and eukaryotic cells that are listed as equivalent in terms of expression of a transfected gene (see columns 4-6). Thus, it would be obvious for one of skill in the art to use a variety of art-recognized vectors to express the polypeptide of SEQ ID NO: 88.

**References used for a better understanding of the art, but not cited:**

Clark, et al, 2003, Genome Research, 13: 2265-2270.

**Conclusion:** Claims 1-20 are rejected for the reasons recited above.

**Advisory information**

Any inquiry concerning this communication or earlier communications from the examiner should be directed to Sandra Wegert whose telephone number is (571) 272-0895. The examiner can normally be reached Monday - Friday from 9:00 AM to 5:00 PM (Eastern Time).

Art Unit: 1647

If attempts to reach the examiner by telephone are unsuccessful, the Examiner's supervisor, Brenda Brumback, can be reached at (571) 272-0961.

The fax number for the organization where this application or proceeding is assigned is 703-872-9306.

Information regarding the status of an application may be obtained from the Patent Application Information Retrieval (PAIR) system. Status information for published applications may be obtained from either Private PAIR or Public PAIR. Status information for unpublished applications is available through Private PAIR only. For more information about the PAIR system, see <http://pair-direct.uspto.gov>. Should you have questions on access to the Private PAIR system, contact the Electronic Business Center (EBC) at 866-217-9197 (toll-free).
